

PT Companion

User Guide — for trainers new to the app

Covers the app as of **version 2.16**, including everything added since v2.12.

A note on the images in this guide

The screens shown throughout are illustrative mockups built to match the app's real layout and colour palette — not pixel-for-pixel screenshots of a live session. They're there to orient you to where things live, not to show exact current data.

Contents

1. What PT Companion does
2. Getting started — logging in and syncing
3. The Clients tab
4. A client's file: Sessions, Programme, Calendar
5. The Programme tab, in depth
6. Exporting a programme — PDF and Gym Tracker
7. Your Details (trainer profile)
8. The Plans and Exercises libraries
9. The Calendar tab
10. Data, backup and sync
11. What's new since v2.12 (full changelog)

1. What PT Companion does

PT Companion is built for one-to-one and small-group personal training. It holds your client roster, the exercise programmes you build for them, the sessions you run, and your appointment calendar — all in one place, synced across your own devices.

The app is organised around four main areas, reachable from the tab bar at the bottom of the screen:

- **Clients** — your roster. Tap a client to open their file.
- **Calendar** — upcoming sessions and appointments across all clients.
- **Plans** — a reusable library of workout plans you can drop into any client's programme.
- **Exercises** — your exercise library, tagged and reusable across plans.

2. Getting started — logging in and syncing

PT Companion works from a single login per trainer. Your data is stored against your account and kept in sync across devices automatically — the sync indicator in the top bar shows a dot that turns green once everything is up to date, amber while a sync is in progress, and red if something needs attention.

You can also take a full backup of your data at any time, or restore from one, via the sync button in the top bar — useful before a big change, or when moving to a new device.

3. The Clients tab

This is the home screen. Each card shows a client's name and, at a glance, which programme is currently active for them. Tapping a client opens their file, where you manage everything specific to that person: their sessions, their programme, and their upcoming appointments.

Clients tab — your roster

4. A client's file: Sessions, Programme, Calendar

Inside a client's file you'll find their own set of tabs — most importantly for this guide, the **Programme** tab, which is where you build and manage what that client is actually training. The rest of this guide focuses on Programme, since it's had the most recent changes.

5. The Programme tab, in depth

A **programme** is a block of training for a client — it runs for an agreed period and can hold several **plans** (e.g. a plan per gym day, plus a general one). Each client can have any number of programmes over time, but only one of them is ever **active** at once.

The programme list

Opening the Programme tab shows every programme you've ever created for this client — active ones and past (archived) ones — most recent first, active always at the top. Each card shows its status, how many plans and exercises it holds, and a ★ **Set active** button if it isn't the current one.

Programme tab — list view (added in v2.14)

Opening a programme

Tapping any programme — active or archived — opens the same detail view. From here you can rename it, adjust its start date and duration, add or remove plans, write programme-level notes, and export it. If it isn't the active one, there's a ★ **Set as active** button here too; using it archives whichever other programme was active for this client, so there's always exactly one active programme per client.

Programme detail view — edit any programme (active or archived), add plans, export

Programme detail view — edit any programme, active or archived

Creating a new programme (via the **+ New programme** button) still automatically makes it the active one and archives whatever came before — the manual toggle above is there for when you want to switch back, or re-activate an old programme without creating a new one.

6. Exporting a programme — PDF and Gym Tracker

Every programme — active or archived — has two export options, sitting alongside its plans:

- ■ **Export PDF** — opens your browser's print dialog with a clean, formatted summary of the programme: every plan, every exercise, and its target sets. Choose “Save as PDF” to keep a copy, or print it directly for a client.
- ■ **Export for Gym Tracker** — downloads a JSON file in exactly the format Gym Tracker's own “Import Program File” expects. Hand this to a client who uses Gym Tracker and they can import it directly — it creates a Program there grouping all the imported plans together.

The PDF now opens with a header banner carrying your own name/business details (see the next section) and the app's icon, followed by the client's name, programme duration and start date, any programme notes you've written, and then each plan as its own table.

PDF export — header banner and notes callout (added in v2.14)

Re-exporting an updated programme: if you revise a programme and a client re-imports it into Gym Tracker, any plan that shares a name with one they already have is added alongside it (tagged with today's date) rather than overwriting or being skipped — so nothing of theirs is silently lost.

7. Your Details (trainer profile)

Tap the ■■■ icon in the top bar to enter your own name, business name, email and phone number. These appear on the header banner of every PDF export, and are included (harmlessly, as extra fields) in Gym Tracker JSON exports too — so a client's file always shows whose programme it is and how to reach you.

Good to know: these details are saved on this device and included in any full backup you take, but aren't yet synced automatically to your other devices — fill them in on each device you use for now.

8. The Plans and Exercises libraries

These two tabs hold your reusable building blocks, shared across every client:

- **Exercises** — your master list, each tagged (e.g. “Chest”, “Core”) and tracked one of three ways: reps, time, or distance.
- **Plans** — a named set of exercises with target sets, that you can drop into any client's programme as a starting point rather than building from scratch each time. Copying a plan into a programme always creates an independent copy — editing it for one client never changes your library template or any other client's copy.

9. The Calendar tab

A combined view of upcoming sessions and appointments across all your clients, so you can see your week at a glance without opening each client individually.

10. Data, backup and sync

The sync button in the top bar opens Data & Backup, where you can trigger a manual sync, export a full JSON backup of everything, restore from a backup file, and sign out of this device.

Restoring a backup is a deliberate “this is the truth now” action — it replaces what's on this device and pushes back up to the cloud, overriding whatever else was there.

This guide itself is one tap away from here too — a **User Guide** link sits under a new Help section at the top of Data & Backup, opening in a new browser tab.

Data & Backup — Help section (added in v2.16)

11. What's new since v2.12 — full changelog

v2.13

Export programmes: PDF and Gym Tracker JSON

- Every programme (at the time, only the active one — broadened in v2.14) gained two export buttons: **Export PDF** and **Export for Gym Tracker**.
- PDF export used the browser's own print-to-PDF, listing each plan with its exercises and target sets — no PDF-specific software needed.
- Gym Tracker export wrote a JSON file in the exact shape Gym Tracker's own import feature expects, so a client's Gym Tracker app could pull in a trainer-built programme directly.

v2.16

User Guide, linked from inside the app

- This guide is now reachable from within PT Companion itself: **Data & Backup** → **Help** → ■■■ **User Guide**, opening in a new browser tab.
- It's a plain link to a PDF, so it opens instantly and works offline once loaded — no extra screen or loading step inside the app.

v2.15

Distance-exercise target/actual sets — time made optional

- For distance-tracked exercises, the distance (metres) is now the only mandatory field — the minutes:seconds time is optional, matching the equivalent change on the Gym Tracker side.
- New distance sets no longer default to a placeholder time; a set with no time logged now displays cleanly instead of showing a misleading “in 0s”.
- No data changes needed — this only affects how sets are entered and displayed, so any existing programme or session data reads correctly either way.

v2.14

Programme list view, trainer details & polished PDF

- **Programme tab redesigned** — every programme for a client (active and archived) now shows in a list up front, instead of only the active one being visible by default.
- **Set active, on demand** — any programme can be made the active one from a single button, whether you're looking at the list or already inside that programme's detail view.
- **Any programme is now fully editable** — archived programmes used to be read-only history; now the same detail view opens for any of them, so you can add plans, fix a note, or export from an old programme just as easily as the active one.
- **Your Details** — a new section (■■■■ icon, top bar) for your own name, business name, email and phone number.
- **PDF exports look more professional** — a header banner now carries the app icon and your trainer details, and programme notes are shown in a clearly separated callout box.

- **Gym Tracker exports carry more context** — your name/business and the programme's notes now ride along as extra fields in the exported JSON file.
